Modern Tkinter – reference card

Pack geometry	.pack(side=TOP, anchor=W, fill=X, expand=YES, padx=5, pady=5) side=LEFT,TOP,RIGHT,BOTTOM; anchor=NEWS or CENTER; fill=X, Y, BOTH, NONE; expand=YES, NO ipadx, ipady – internal padding; padx, pady – external padding
Grid	.grid(row=1, column=2, rowspan=2, columnspan=2, sticky=NEWS or CENTER, padx=5, pady=5)
Place	.place(x=5, y=5, relwidth=1, relheight=1, width=-10, height=-10)

import tkinter as tk

Canvas	Canvas(parent)
Carivas	id = canvas.create_rectangle((10, 10, 30, 30), fill="red", tags=("palette", "palettered"))
	canvas.tag_bind(id, " <button-1>", lambda x: setColor("red"))</button-1>
	canvas.itemconfigure('palette', width=5)
Listbox	ListBox(parent, bg="#1C3D7D", fg="#A0B9E9", selectmode=EXTENDED)
	mylist.insert(0, "First Item"); mylist.insert(END, "Last Item");
	mylist.curselection()[0] # returns first selected item
PhotoImage	photoimage = PhotoImage(file="images/openfile.gif") # has to be GIF or PNG
ScrolledText	scrolledtext.ScrolledText(parent)
Spinbox	Spinbox(parent, from_=1, to=10, width=5, textvariable=varint)
Text	Text(parent, background="#101010", foreground="#D6D6D6", borderwidth=18, relief="sunken",
	width=16, height=5)
tkMessageBox	showwarning("Beware", "You are warned"); showinfo("FYI", "This is FYI", icon='question');
	showerror("Err", "its leaking."); askquestion("?", "Can you read this ?"); askokcancel("OK", "Quit
	Postponing ?"); askyesno("Yes or No", " What Say ?"); askretrycancel("Retry", "Load Failed")
tkFileDialog	askopenfile, askopenfilename, asksaveasfile, asksaveasfilename, askdirectory
Toplevel	Toplevel(parent) # main class for windows and dialogs

from tkinter import ttk

Button(parent, text="Search", image=photoimage, compound=tk.LEFT, command=func)
btn.image = photoimage # for some reason this is required to set image
Checkbutton(parent, text="Remember me", variable=varint, onvalue=3, offvalue=44)
Combobox(parent, values=["one", "two"], state="readonly")
cm.current(newindex=None); cm.get(); cm.set(value)
Entry(parent, width=30, textvariable=varstr); entry.set("value"); var = entry.get()
Frame(parent, height=25, bg="light sea green")); # use it to hold widgets for toolbars, sidebars
Label(parent, text="I am a label widget"); label["text"] = "reset text"
LabelFrame(text="some label", height=200, width=200); # used in dialogs to group items
Menubutton(parent, text="some text", menu=mymenu)
Notebook(parent); note.add(child, text="tab 1", state="normal")
OptionMenu(parent, var, "Select Country", "USA", "UK", "India") # similar to readonly Combobox
PanedWindow(master, orient=HORIZONTAL, sashwidth=8); paned.add(child, width=300)
Progressbar(parent); prog.step(amount=None); prog.start(interval=None); prog.stop()
Radiobutton(parent, text="one", variable=varint, value=1)
Scale(root, variable=varint, from_=0, to=10)
Scrollbar(parent, orient=VERTICAL, command=mytext.yview)
Separator(parent, orient=HORIZONTAL)
Sizegrip(root).pack(side=BOTTOM, anchor=E)
ttk.Treeview(parent, columns=("size", "modified"))
tree.column("size", width=100, anchor=NEWS or CENTER); tree.heading("size", text="Size")
tree.set("widgets", "size", "12KB")
if id = "" then inserts as a root item, if id has value then inserts as child of node id
tree.insert(id, "end", text="button", tags=("one", "simple"), values=("15KB", "Yesterday"))
tree.tag_configure("one", background="yellow")
tree.tag_bind("one", "<1>", itemClicked); # the item clicked can be found via tree.focus()

root = Tk() # root is instance of Toplevel class
root.title("title of my program")
root.geometry("142x280+150+200")
root.iconbitmap("mynewicon.ico")
root.configure(background="#4D4D4D") #top level styling
root.mainloop()

Adding Menubar in the widget

menubar = Menu(root)
filemenu = Menu(menubar, tearoff=0) # File menu
mymenu.add_command(label="Mylabel", accelerator="<F5>", compound=LEFT, image=myimage,
underline=0, command=callback)
viewmenu.add_checkbutton(label="Show Line Number", variable=showIn)
viewmenu.add_cascade(label="Themes", menu=themesmenu)
themesmenu.add_radiobutton(label="Default White", variable=theme)
root.config(menu=menubar) # this line actually displays menu

Adding Pop-up menu

self.context_menu = Menu(self.root, tearoff=0)
self.context_menu.add_command(label="Play", command=self.identify_track_to_play)
self.context_menu. add_checkbutton(label="checkmark_here", variable=myvar)
def show_context_menuContext_menu(self, event):
 self.context_menu.tk_popup(event.x_root+45, event.y_root+10,0)

mystring = StringVar()
ticked_yes = BooleanVar()
option1 = IntVar()
volume = DoubleVar()

myvar.set("Wassup Dude") # setting value of variable
myvar.get() # Assessing the value of variable from say a callback

Tie scrollbar to widget:

list = Listbox(root, height=6, width=15)
scroll = Scrollbar(root, command=list.yview)
list.configure(yscrollcommand=scroll.set)

Validation

Works on Entry, Combobox, Spinbox	
%P – entered value	vcmd = (self.master.register(self.validate_email), "%P")
%s - value prior to editing	invcmd = (self.master.register(self.invalid_email), "%P")
%S - text string being inserted/deleted, {}	self.emailentry = tk.Entry(self.master, validate =
otherwise.	"focusout", validatecommand=vcmd, invalidcommand=invcmd)
none - no validation	def invalid_email(self, P):
focus - combines focusin and focusout	self.errormsg.config(text="Invalid Email Address")
focusin - validate when the widget receives focus	self.emailentry.focus_set()
focusout - validate when the widget loses focus	
key - validate when the entry is edited	
all - validate called in all the above cases	
	def validate_email(self, P):
Return False if validation fails	self.errormsg.config(text="")
	x = re.match(r"[^@]+@[^@]+\.[^@]+", P)
	return (x != None) # True/False valid email/invalid email

Widget Events

An application-level binding: Application-level bindings will let you use the same binding across all windows and widgets of the application, as long as any one window of the application is in focus. The syntax for application-level bindings is:

root.bind_all("<F1>", show_help)

mouse buttons	<button-1>, <button-3></button-3></button-1>
double click	<pre><double-button-1>, <double-button-3></double-button-3></double-button-1></pre>
double click	\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\
mouse movement	<focusin>, <focusout>,</focusout></focusin>
over widget	<motion>, <enter>, <leave></leave></enter></motion>
over waget	amodoni y senter y secure.
keyboard events	<return>, <escape>, <a>, <f5>, <key> , <shift-up></shift-up></key></f5></escape></return>
Reyboard events	Alectarity (250aper) 407 (157) string op
button released	<buttonrelease-1></buttonrelease-1>
drag like motion	<b1-motion> The mouse is moved, with mouse button 1 being held down (use B2 for the</b1-motion>
	middle button, B3 for the right button)
	, , ,
widget changed size	<configure></configure>
disconnect from event	widget.unbind(event)
Button, Checkbutton,	Use command=func parameter for default action, read value of the variable attached to the
Radiobutton,	button if it has state.
menu.add_command	
Combobox	< <comboboxselected>> virtual event when the user selects an element from the list of values</comboboxselected>
Notebook	< <notebooktabchanged>> virtual event after a new tab is selected</notebooktabchanged>
Treeview	< <treeviewselect>> Generated whenever the selection changes.</treeviewselect>
	< <treeviewopen>> Generated just before settings the focus item to open=True.</treeviewopen>
	< <treeviewclose>> Generated just after setting the focus item to open=False.</treeviewclose>
	.focus() and .selection() methods can be used to determine the affected item or items
TopLevel	root.protocol("WM DELETE WINDOW", self.exit app) # handle closing via "X" button
<u>'</u>	root.bind(" <return>", self.ok)</return>
	root.bind(" <escape>", self.cancel)</escape>

Widget State

active	The mouse cursor is over the widget and pressing a mouse button will cause some action to occur
disabled	Widget is disabled under program control
focus	Widget has keyboard focus
pressed	Widget is being pressed
selected	"On", "true", or "current" for things like Checkbuttons and radiobuttons
background	Windows and Mac have a notion of an "active" or foreground window. The background state is set for
	widgets in a background window, and cleared for those in the foreground window
readonly	Widget should not allow user modification
alternate	A widget-specific alternate display format
invalid	The widget's value is invalid

A state is a **sequence of state names**, optionally prefixed with an **exclamation point** indicating that the bit is off.
